

## **ENVIRONMENTAL WATER MONITORING ALONG CANADIAN WATER WAYS**

The company I work for is very environmentally conscientious. It goes above and beyond regulations to ensure there is the least possible damage done to the ecosystems. We do construction along waterways and that is where the Spectrex PC-2200 comes in. Water samples from the construction areas are analyzed with the particle counter to determine the level of sediment found in the water. We perform this analysis frequently to ensure we do not damage or destroy the water life by causing too much erosion therefore creating more sediment in the water.
